RECOMMANDATIONS

CVE-2017-15710:
- Description : In Apache httpd 2.0.23 to 2.0.65, 2.2.0 to 2.2.34, and 2.4.0 to 2.4.29, mod_authnz_ldap, if configured with AuthLDAPCharsetConfig, uses the Accept-Language header value to lookup the right charset encoding when verifying the user's credentials. If the header value is not present in the charset conversion table, a fallback mechanism is used to truncate it to a two characters value to allow a quick retry (for example, 'en-US' is truncated to 'en'). A header value of less than two characters forces an out of bound write of one NUL byte to a memory location that is not part of the string. In the worst case, quite unlikely, the process would crash which could be used as a Denial of Service attack. In the more likely case, this memory is already reserved for future use and the issue has no effect at all.
- Recommandation : Upgrade Apache httpd to a version that is not vulnerable to this issue. If an upgrade is not possible, consider

disabling AuthLDAPCharsetConfig or using a charset conversion table that includes all possible Accept-Language header values.

CVE-2017-15715:
- Description : In Apache httpd 2.4.0 to 2.4.29, the expression specified in could match '$' to a newline character in a malicious filename, rather than matching only the end of the filename. This could be exploited in environments where uploads of some files are are externally blocked, but only by matching the trailing portion of the filename.
- Recommandation : Upgrade Apache httpd to a version that is not vulnerable to this issue. If an upgrade is not possible, consider using a different method for blocking uploads of certain files.

CVE-2018-1303:
- Description : A specially crafted HTTP request header could have crashed the Apache HTTP Server prior to version 2.4.30 due to an out of bound read while preparing data to be cached in shared memory. It could be used as a Denial of Service attack against users of mod_cache_socache. The vulnerability is considered as low risk since mod_cache_socache is not widely used, mod_cache_disk is not concerned by this vulnerability.
- Recommandation : Upgrade Apache httpd to a version that is not vulnerable to this issue. If an upgrade is not possible, consider disabling mod_cache_socache or using mod_cache_disk instead.

CVE-2017-3167:
- Description : In Apache httpd 2.2.x before 2.2.33 and 2.4.x before 2.4.26, use of the ap_get_basic_auth_pw() by third-party modules outside of the authentication phase may lead to authentication requirements being bypassed.
- Recommandation : Upgrade Apache httpd to a version that is not vulnerable to this issue. If an upgrade is not possible, consider reviewing third-party modules and ensuring that they are only called during the authentication phase.

CVE-2017-3169:
- Description : In Apache httpd 2.2.x before 2.2.33 and 2.4.x before 2.4.26, mod_ssl may dereference a NULL pointer when third-party
